# Job Market Paper

**<u>Eric B. Zhou</u>**; Dokyun Lee; Gordon Burtch; Daniel Rock; Prasanna Tambe. "Generative Al and Creative Markets: Artist, Artwork, & Market Impacts of Al Entry & Data Protections."

Preparing for submission to Management Science

\*Manuscript available upon request.

"The emergence of generative artificial intelligence (AI) has sparked debate about its impacts on creative markets, echoing concerns raised nearly 200 years ago with the advent of photography. While historical precedents such as the introduction of photography and Photoshop initially sparked fears of artistic displacement, they ultimately spurred new genres and market expansion. This paper examines how creators respond to competitive dynamics introduced by generative AI, specifically analyzing their

decisions to adopt AI tools and/or privatize their intellectual property from AI training systems via an optout mechanism and the implications of these strategic choices on creative markets. Using artist- and artifact-level data from an industry art platform, we find that the market is increasingly dominated by AIgenerated content as AI-sensitive creators reduce participation on the platform. To understand artifactlevel shifts, we develop Visual-Concept Modeling - a multimodal feature extraction approach to scalably characterize prototypical artifacts based on visual and conceptual elements - that enables us to identify that AI-assisted creators concentrate production in character concept art while those opting out strategically navigate towards other genres. These findings suggest current data governance practices - particularly the use of artist work for AI training without consent or compensation - may inadvertently have a concentration effect on the market, potentially marginalizing artists lacking the human capital or willingness to adapt. We conclude by emphasizing the urgent need for revised data protection policies, such as strengthened copyright enforcement and opt-in datasets, to foster equitable participation and long-term sustainability within AI-mediated creative markets."

"Artists are rapidly integrating generative text-to-image models into their workflows, yet how this human—Al collaboration affects creative discovery remains unclear. Leveraging large-scale data from an online art platform, we compare Al-assisted creators to matched non-adopters to assess novel idea contributions. Initially, generative Al increases novelty among a concentrated subset of artists, driven primarily by substantial productivity gains; however, marginal novelty per artifact declines post-adoption, reflecting a shift toward high-volume, incremental exploration, ultimately yielding a greater aggregate of novel artifacts by Al adopters. We observe no evidence of a human–Al complementarity effect beyond productivity-driven gains. Notably, the release of open-source Stable Diffusion accelerates novel contributions across a broader, more diverse group, suggesting that text-to-image tools facilitate exploration at scale, initially enabling persistent breakthroughs by a select "mastermind" group, driven by substantial volume increases, and subsequently enabling widespread novel contributions from an emergent "hivemind" of artists."

"Recent artificial intelligence (AI) tools have demonstrated their ability to produce outputs traditionally considered creative. One such system is text-to-image generative AI, which automates humans' execution to generate high-quality digital artworks. Utilizing a dataset of over 4 million artworks from more than 50,000 unique users, our research shows that text-to-image AI substantially enhances human creative productivity by 25% and increases the likelihood of receiving a favorite per view by a similar percentage. While peak artwork content novelty (focal objects and object relationships) increases over time, average content novelty declines, suggesting an expanding but inefficient creative space. Additionally, there is a consistent reduction in visual novelty (pixel-level stylistic elements). Importantly, AI-assisted artists who can produce more novel ideas, regardless of overall novelty prior to adoption, produce artworks that their peers evaluate more favorably. The results imply that ideation and likely filtering are necessary skills in the text-to-image process, thus giving rise to "generative synesthesia" - the harmonious blending of human senses and AI mechanics to discover new creative workflow."

"In online marketplaces, sellers can rely on alternative mechanisms to signal their quality when they lack rich transaction histories. Using scraped data on GPU sales from eBay, we find that certain image signals can substitute for reputation to increase conversion rates amongst sellers with less than 100% positive reputation, and conditional on making a sale, can realize a 5% price premium on average. However, the effects are only significant for less reputable sellers."
